
Data: A30_WP0/a24b_partial_id_summary.json (a,b), a24b_capacity_table.csv (c); A39_WP8_external-validity/wp8_real_reuse_cases_summary.json (d), wp9_cooling_share_summary.json (e), wp10_water_price_summary.json (f) - all three from the Shen et al. 2026 Nature Water source-data package (CC-BY). Superseded claim 'above 95% of real facilities are fully committed' = WITHDRAWN_AS_UNIDENTIFIED.

n = 10,826 real treatment plants (b,c). WP8: n = 141 projects (38 with capacity, 40 with cost). WP9: n = 39 of 41 sectors with a mean (2 missing, counted explicitly, not zero-filled). WP10: 62 city tariff series / 7,730 monthly observations / 61 summarisable cities. No point estimate and no CI is reported for the committed share, because the parameter is not identified.

LIMITATION: panel c states CAPACITY FEASIBILITY only - a plant COULD exceed the modelled threshold; it says NOTHING about existing demand. The WP8 catalogue is a CASE COLLECTION, NOT A RANDOM SAMPLE, so 28.4% is not a national prevalence; it has NO demand-side field and therefore does NOT shrink or weaken the [0%, 100%] bound of panel a. WP10 is an order-of-magnitude comparison only: prices with no contracts or allocations, so no causal claim and no investment or net-present-value statement.
